

ASC

Avercast Supplier Connection

Avercast Supplier Connection (ASC) integrates seamlessly with Avercast Business Forecasting. ASC takes your product forecasts and puts them onto a secure server as "projected orders." You're then able to give each supplier a passcode that enables them to log onto the secure server over the internet and view only the information that pertains to their business.

Letting your vendors know what you're going to order from them and when can provide a key strategic advantage. It enables your vendors to have the product you need in inventory when you need it.

ASC can also serve as a tool for negotiation. Vendors are often willing to offer price breaks and cut lead times on products if they know ahead of time when you are planning on ordering.

Software Benefits:

- Displays projected orders out into the future
- Vendors only see what information pertains to them
- Enables real-time collaboration with suppliers
- Reduce vendor lead times
- Negotiate price breaks
- Password protected over a secure network
- Zero deployment for vendors (only an internet browser is required)
